

Elgas: Verification of Carbon Footprint Assessment

Elgas has conducted a rigorous and comprehensive assessment of the carbon emissions associated with the use of their SWAP'n'GO Green product. This assessment is precautionary and represents, if anything, an over-statement of the emissions associated with using the LPG within the cylinder. We note that the emissions associated with the production of the SWAP'n'GO Green cylinder itself has not been included in this assessment. Elgas has been transparent and clear on this fact. Elgas are tracking information on the number of carbon credits which need to be retired in a robust and continuous process. They are purchasing credits upfront of the use of their product. These credits are robust in that they are additional, auditable and have certainty of delivery of reduced emissions.
